

EXTRACT

A distributed data-mining software platform for
extreme data across the compute continuum

TASKA Use Case

Transient Astrophysics with an SKA pathfinder

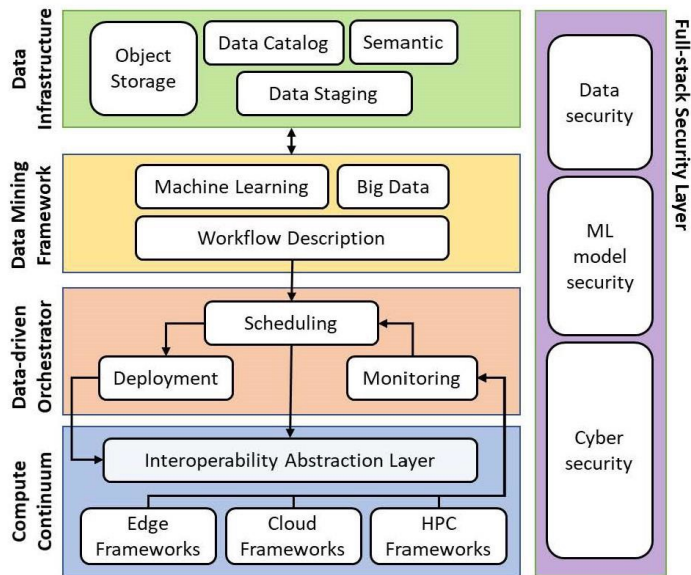

B. Cecconi and the EXTRACT & TASKA teams

The EXTRACT Project has received funding from the European Union's
Horizon Europe programme under grant agreement number 101093110

Project Goal

- Delivering a data-driven **open-source platform** integrating cloud, edge and HPC technologies for trustworthy, accurate, fair and green **data mining workflows** for high-quality actionable knowledge

Example software platforms to be assessed

- **Lithops** — <https://lithops-cloud.github.io/>
Lithops is a Python multi-cloud serverless data processing framework able to run massively parallel functions on data from Object Storage.
- **Nuvla** — <https://nuvla.io/>
Edge-to-cloud management platform software, with support for marketplaces of business applications.
- **COMPS** — <http://www.bsc.es/compps>
SW development framework for the transparent distribution of workflows in a distributed computing infrastructure (data-centers, clusters, clouds).
- **Ray** — <https://www.ray.io/>
Ray is a high-performance distributed execution framework targeted at large-scale machine learning and reinforcement learning applications.
- **DataClay** — <https://dataclay.bsc.es/>
Distributed storage system used in HPC, edge/cloud environments to maintain user-defined data consistency, by defining visibility scopes. It is integrated in COMPSs.

TASKA Use Case

Transient Astrophysics with an SKA Pathfinder

- **NenuFAR**: an SKA Pathfinder, located in Nançay (France)
- **Edge** data processing, in Nançay, real time data analysis:
« *Beam forming* » mode, goal = *Analog-to-information*
Detect (AI) structures => decision on resolution of data output
- **Cloud** data processing in Datalake (NenuFAR data centre):
Post-processing of « Imaging » data:
 - orchestration of staging, computing, optimisation of workflow
 - generic processing (calibration, source removal...)
 - specific heavy processing (e.g., dynamic spectrum extraction from visibilities)

Dynamic imaging of transient / variable sources in visibility space:
- decomposition of components/calibration in visibility space

The logo for the EXTRACT project. The word "EXTRACT" is written in a bold, sans-serif font. The letter "A" is stylized, with a vertical bar on its left side and a series of three dots below it. The "E" is a dark blue color, while the rest of the letters are a lighter blue. The background of the top half of the slide is a dark blue gradient with faint, glowing lines and patterns, suggesting a digital or data environment.
